

ESCAPE HOOKUPS & PAD FACT SHEET

Note: All of the utility connections are located on the right side of the unit when looking from the hitch (opposite side from the front door). There is a 25' extension cord for power and a 10' hose for septic included, so no need to try and hit the exact spot for the utilities.

Pad – Your unit needs to sit on a firm, flat, level pad that can be concrete, blacktop, crushed rock or gravel...it needs to be firm, flat and accessible for delivery. Please see the size of your unit on the website...the pad should be 3-5' beyond the size of your unit.

Power - Our units require either a 120v/30a (3 prong) or 240v/50a (4 prong) outlet. See pictures at left- 50a is on the left, 30a is on the right. We include a 25' power cord with each unit.

Water - The water inlet is a standard 3/4" hose connection. Use a hose that is designed for drinking water. Good water pressure is essential. We highly recommend using an in line water filter. If you are in a cold climate, please use a heated hose.

Septic - The unit has a 3" out for septic...see the picture. We include a 10' flexible hose that ties to this output OR you can simply tie right to the 3" output.

TV/Cat5 - The unit has a F connector for coax cable...see picture. A Cat5 box is included in the unit and wiring is on the outside for your cable or internet provider. Note: we know many customers may not use these hook ups, but they are available.

LP Gas - Each ESCAPE unit that is not all electric comes with a functional LP gas system, including two 20lb. tanks and an automatic changeover valve.
